ASNT8010-PQB
DC-17*GHz* Programmable Integer Divider

- Wide frequency range from DC to 17*GHz*
- Continuous division ratios from 1 to 256
- 50% duty cycle of the output divided clock signal
- Fully differential CML input interface
- Fully differential CML output interface
- Easy 8-bit parallel programming interface compatible with CMOS/LVTTL standards
- Optional external reset function
- Optional dynamic mode of the division ratio adjustment with a short set-up time (about 20*ns* after the pulse edge on any control input)
- Single +2.8*V* or -2.8*V* power supply
- Industrial temperature range
- Standard 40-pin QFN package with a thermal pad

DESCRIPTION

ASNT8010-PQB is a high-speed programmable integer clock divider with static or dynamic adjustment of the division ratio through a standard 8-bit parallel LVTTL/CMOS interface and optional external reset (active-high CMOS/LVTTL signal). The functional block diagram of the device is shown in Fig. 1.

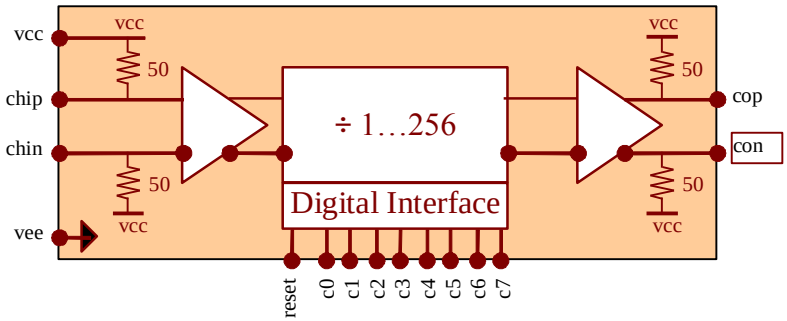

Fig. 1. Functional Block Diagram

The divider accepts an input clock signal chip/chin with a speed from DC to the maximum specified frequency and provides a clean 50% duty cycle output divided clock signal cop/con in any operational mode. The divider allows for both static and dynamic adjustment of the division ratio from 1 to 256 with a step of 1. In the static mode, the binary code on the control inputs c0-c7 defines the value of the ratio from 1 to 255, where c7 is the most significant bit. All "0"s ("low" state) define the division by 256. Following any change of the control signals in the dynamic mode, the divider switches to idle after (64...128) periods of the high-speed system clock plus an additional 1.6*ns* delay, and returns back to normal operation with the new division ratio after an additional delay equal to 192 periods of the high-speed system clock.

The device automatically resets itself after the initial power-up and any change of the division control signals. When the optional external reset signal reset is set to "high", the divider switches to idle (static "0" output) after a 0.7*ns* delay as shown in the timing diagram in Fig. 2. When reset returns to "low", the divider switches back to normal operation after (64...128) periods of the high-speed system clock plus an additional 1.6*ns* of delay. The minimum allowed reset pulse must not be shorter than 64 periods of the high-speed system clock.

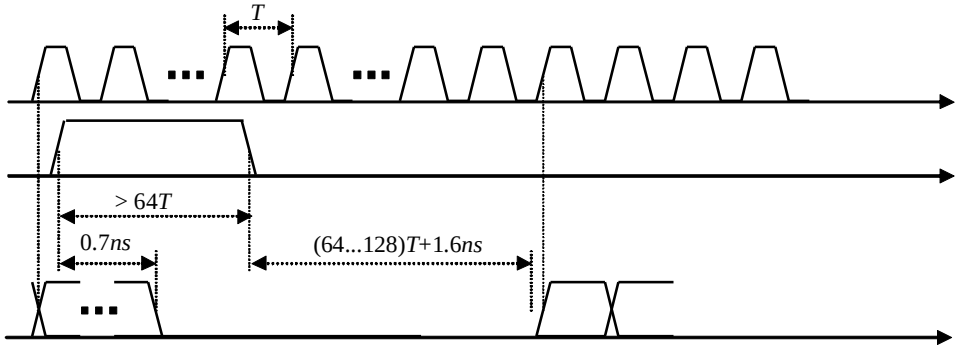

Fig. 2. Timing Diagram

The part's I/O's support the CML logic interface with on chip 50*Ohm* termination to vcc and may be used differentially, AC/DC coupled, single-ended, or in any combination (also see POWER SUPPLY CONFIGURATION). In the DC-coupling mode, the input signal's common mode voltage should comply with the specifications shown in ELECTRICAL CHARACTERISTICS. In the AC-coupling mode, the

www.adsantec.com

input termination provides the required common mode voltage automatically. The differential DC signaling mode is recommended for optimal performance.

POWER SUPPLY CONFIGURATION

The ASNT8010-PQB can operate with either a negative supply (vcc=0.0*V*=ground and vee= -2.8*V*), or a positive supply (vcc= +2.8*V* and vee = 0.0*V* = ground). In case of the positive supply, all I/Os need AC termination when connected to any devices with 50*Ohm* termination to ground. Different PCB layouts will be needed for each different power supply combination.

The external circuit shown in Fig. 3 may be used to reduce the power consumption. The resistor value may be from 20*Ohm* to 61*Ohm*. Any silicon diode with a voltage drop close to 0.8*V* can be used instead of the specified part MA2SP0111L, if required.

Please be aware that reduced current may result in lower maximum frequency!

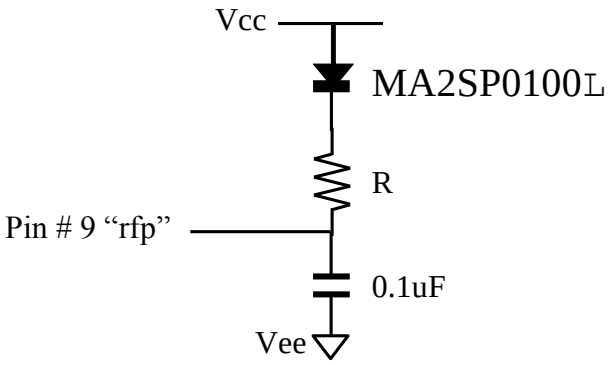

Fig. 3. Power Control Circuit

All the characteristics detailed below assume vcc = +2.8*V* and vee = 0*V*.

ABSOLUTE MAXIMUM RATINGS

Caution: Exceeding the absolute maximum ratings shown in Table 1 may cause damage to this product and/or lead to reduced reliability. Functional performance is specified over the recommended operating conditions for power supply and temperature only. AC and DC device characteristics at or beyond the absolute maximum ratings are not assumed or implied. All min and max voltage limits are referenced to ground.

Table 1. Absolute Maximum Ratings

Parameter	Min	Max	Units
Supply Voltage (vcc)		+3.3	*V*
Power Consumption		2.5	*W*
RF Input Voltage Swing (SE)		1.0	*V*
Case Temperature		+90	*ºC*
Storage Temperature	-40	+100	*ºC*
Operational Humidity	10	98	*%*

TERMINAL FUNCTIONS

TERMINAL			DESCRIPTION
Name	**No.**	**Type**	
High-Speed I/Os			
chip	5	CML input	Differential clock inputs with internal SE 50*Ohm* termination to VCC.
chin	7		
cop	17	CML output	Differential divided clock outputs with internal SE 50*Ohm* termination to VCC. Require external SE 50*Ohm* termination to VCC.
con	15		
Controls			
c0	30	CMOS input	Digital division control signals.
c1	29		
c2	28		
c3	27		
c4	25		
c5	24		
c6	23		
c7	22		
rfp	9	Input	Power control pin. Requires external components. See Fig. 3.
reset	32	CMOS input	External reset signal

Supply And Termination Voltages		
Name	**Description**	**Pin Number**
vcc	Positive power supply. (+2.8*V* or 0)	4, 6, 8, 13, 14, 16, 18, 26, 33, 34, 35, 36, 37, 38
vee	Negative power supply. (0*V* or -2.8*V*)	1, 2, 3, 10, 11, 12, 19, 20, 21, 31, 39, 40

PACKAGE INFORMATION

The chip is packaged in a standard 40-pin QFN package shown Fig. 4. It is recommended that the center heat slug located on the back side of the package is soldered to ground to help dissipate heat generated by the chip during operation.

The part's identification label is ASNT8010-PQB. The first 8 characters of the name before the dash identify the bare die including general circuit family, fabrication technology, specific circuit type, and part version while the 3 characters after the dash represent the package's manufacturer, type, and pin out count.

This device complies with the Restriction of Hazardous Substances (RoHS) per EU 2002/95/EC for all six substances.
