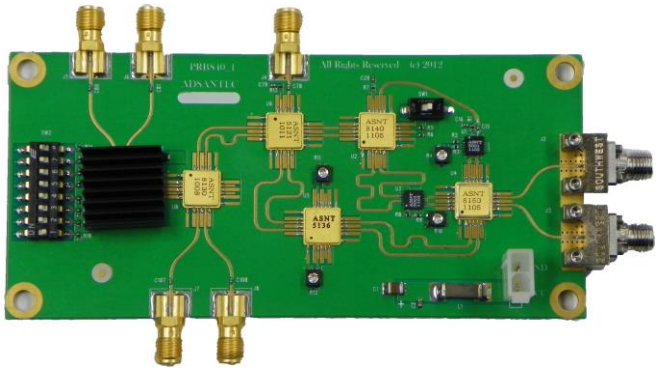
ASNT_PRBS40_1
4*Gbps* -44*Gbps* 2^7-1 PRBS Generator with Sync Output

- Broadband frequency range 4*Gbps* – 44*Gbps*
- Adjustable clock duty cycle for MUX
- 2-512 divide differential sync output
- Static divide by four differential output
- AC coupled single-ended Clock Input
- Minimal insertion jitter
- Fast rise and fall times
- 50% duty cycle sync output on all divide ratios
- Single +3.3*V* supply



DESCRIPTION

The ASNT_PRBS40_1 is a broadband 2^7-1 PRBS generator intended for test, prototyping, microwave, and communication applications. A single-ended clock from 2*GHz* to 22*GHz* is used. This single-ended Clock Input feeds a static differential Divide by 4 Output, an adjustable differential divide by 2 to 512 Sync Output, a differential clock that supplies the multiplexer responsible for doubling the data rate up to 44*Gbps*, and a differential clock that triggers the PRBS 2^7-1.

The Clock Input, Sync Output, and Divide by 4 Output are AC coupled on board. The PRBS Output is DC coupled operating with a common mode level above ground.

On board trim potentiometers allow adjustment of the clock's duty cycle that feeds the multiplexer. They also adjust the phase shift delay for both data paths fed into the multiplexer. This adjustment capability ensures the best operating point for the desired waveform output. An on board PRBS reset switch is included to preset the generator to avoid the all zero state lock-up.

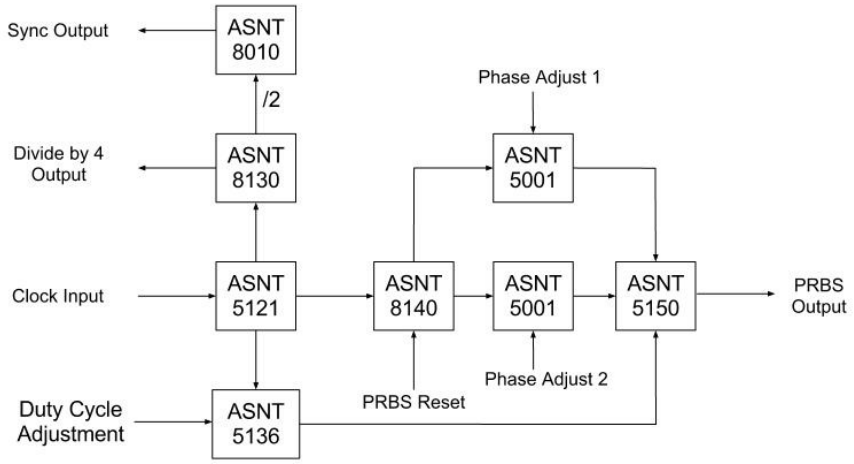
FUNCTIONAL BLOCK DIAGRAM



Sync Output

Using the Sync Output to trigger an oscilloscope will display an eye diagram at divide-by-32 and a PRBS waveform output for 254 or 508. It contains eight switches that represent 8 bits. The LSB starts at SW1 and the MSB ends at SW8. The binary value of zero gives a decimal n value of 512. Increasing binary values increases the decimal value n.

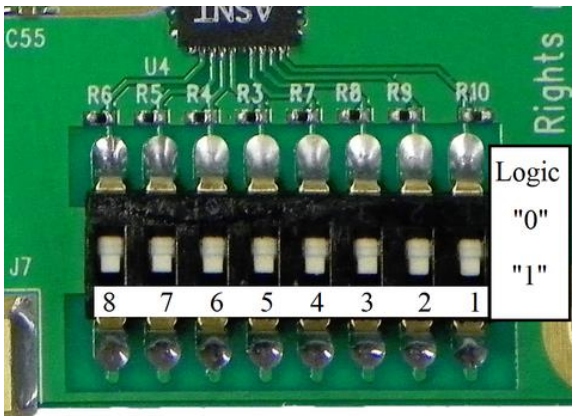


Table 1. Divide ratio

DIP SW # 8 7 6 5 4 3 2 1	n Divide Ratio	
0 0 0 0 0 0 0 1	2	
0 0 0 0 0 0 1 0	4	
0 0 0 1 0 0 0 0	32	Eye diagram
.		
0 1 1 1 1 1 1 1	254	pattern
1 1 1 1 1 1 1 0	508	pattern
0 0 0 0 0 0 0 0	512

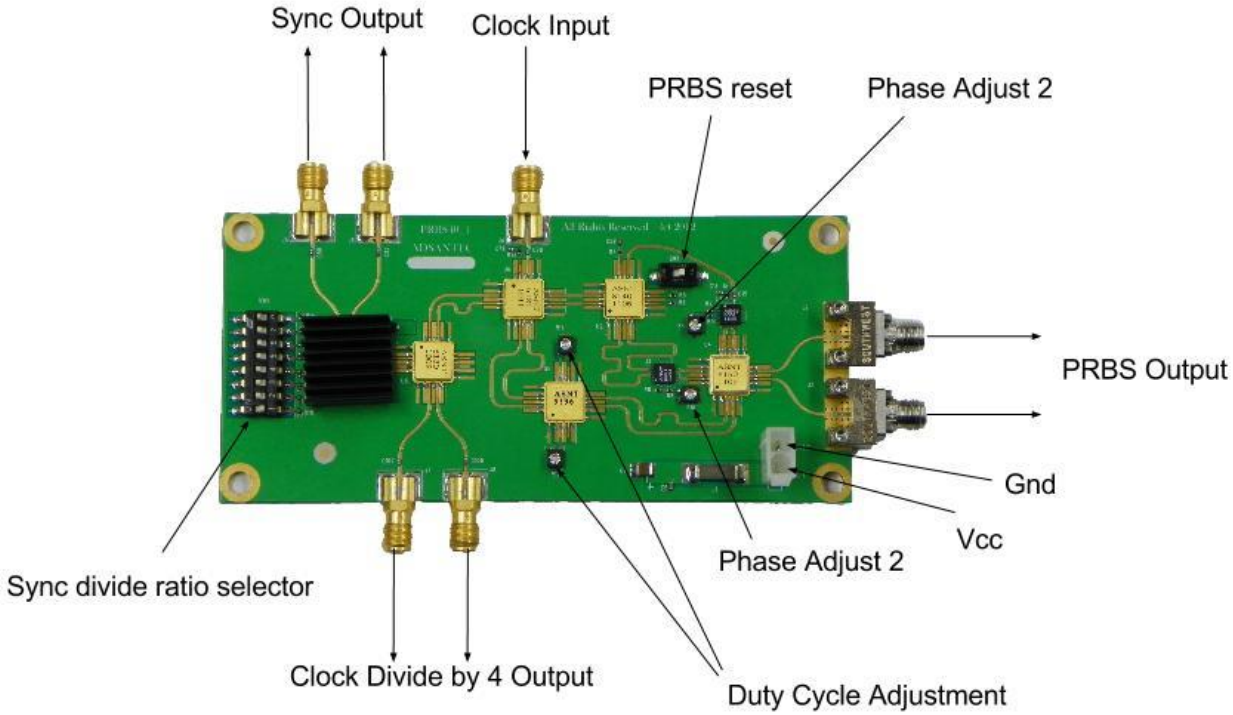
TERMINAL FUNCTIONS



OPERATION

1. Measure 50*Ohms* on all SMA connectors referenced to vcc.
2. Set the PRBS Reset switch to the off position.
3. Set the power supply to 0V and current limit it to 1.7*A*.
4. Connect the power supply to the board and slowly increase to +3.3*V*.
5. Apply a DC coupled single-ended clock to the Clock Input. The Clock Input is AC coupled on board.
6. Connect PRBS Output to a 50*Ohm* terminated oscilloscope single-ended/differentially.
7. Connect Sync Output to trigger single-ended/differentially.

   Note: If using a single-ended input/output only, apply an AC coupled 50Ohm termination to the unused input/output. This will reduce any noise present.

7. Toggle PRBS Reset to turn on the PRBS pattern. (Turn it on then off)
8. Use a divide-by-32 ratio for the Sync Output to view the eye pattern on the oscilloscope.
9. It is crucial that both Duty Cycle Adjustments are tuned to achieve the best output performance. When observing the waveform on the oscilloscope, adjust both controls until

www.adsantec.com

the best symmetry is achieved. Do not adjust the Phase Adjust control until both Duty Cycle Adjustments are at a position where symmetry on the waveform is at its best.

10. When the Duty Cycle Adjustments are done, then change both Phase Adjusts to correct the phase of the data relative to each other, and to the clock to achieve the best eye waveform output.
11. The potentiometers are 1-turn and may be turned in one direction continuously without damage to the ASIC.

    Note: If the clock input rate is changed, repeat steps 7, 9 and 10. The PRBS output contain K-Type SMA connectors. For best performance, use K-Type connectors.

REVISION HISTORY

Revision	Date	Changes
1.4.1	07-2013	Updated minimum output date rate
1.3.1	05-2013	Revised title Revised description Renamed overview to terminal functions Revised operation Revised electrical characteristics
1.2.1	07-2012	Updated operation procedures
1.1.1	06-2012	Updated electrical characteristics Added overview
1.0.1	06-2012	Initial release
